

Gedanken

nelin

I want to mess the velocity so I have to use a Mikrocontroller. The current has to be turned off at the right time so it wont get

pulled back to the middle by the magnetic force. I need a suitable sensor to detect the ball.

Infrared Obstacle Sensor
(IOS)

IOS

no current $\Rightarrow$ timer activated until next coil then $\frac{\Delta S}{\Delta t} = v$

but the system has to wait a bit after the ball goes through the coil, so it won't lose its velocity.

the loop continues...

Pseudo Code:

```
if(sensor == on) { turn off the current for 1 second }
```

Sensor idea

Infrared light Sensor
